

PRODEX THERMAL CURTAINS

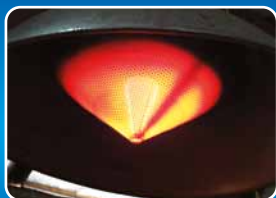

The most effective solution for the poultry sector

**STANDARIZE RECEPTION TEMPERATURES
AND SAVE UP TO 30% IN GAS**

Energy and money savings.

- ✓ Reduction of electricity consumption (in farms with controlled environment).
- ✓ Reduce gas consumption.

Increase the feeding activity. Greater bird comfort.

- ✓ Because the reflective capacity increases by 20% of luminosity in the sheds, a situation that helps birds be fed longer.

Better technical initial production parameters. Standard temperature.

- ✓ Reduction of temperature fluctuations during the first 12 days of bird growth.

Desinfection input savings.

- ✓ Better sanitary performance. Since it is a closed-cell and water-proof product, it is easier to wash and impurities are not adhered to surfaces.

PRODEX THERMAL CURTAINS

Prodex thermal curtains are manufactured with the reflective thermal insulation Prodex Poultry PADP (Polyester + Double Aluminum + Polyester) with a polyethylene foam core of 5 mm thick, folds separated every 14 centimeters and a height according to the indications of each shed.

Lateral Curtain

It effectively reflects the heat produced by gas brooders

Cross-sectional Curtain

Customize your reception area

Lateral curtains are placed in the interior of the shed only in the site devoted to receiving broilers. Their main purpose is to control the internal climatic conditions during the first 12 days of brooding during which gas is used to keep temperatures at 32°.

Comfort in harmony with the environment
